New plating for IK25 couplings

Based on a new EU regulation it is no longer allowed to use chromium trioxide for the new production of fittings during the plating process. As a result we are changing the couplings for our IK25 pressure hose, suited for sewer cleaning vehicles, for flushing drains and sewers in industry, commerce and infrastructure.

With the new plating the performance in terms of corrosion resistance will increase significantly. The most visual change will be the colour which changes from gold to silver.

Currently the former design is still being used for the running production as existing quantities are being processed. It is expected that the gradual transition process – switch from old to new coupling design - should be finished by the end of Q1 2019.

The most important information at a glance:

Improved corrosion resistance and lifetime expectancy

The new fittings show a significantly better performance according to DIN 50962 (corrosion resistance) which means better quality and a longer lifetime.

Improved performance at the same price

The double advantage for the customer:
Better quality will be offered while the price remains at the current level.

New design, new visual appearance

The change is evident even visually – original fittings in gold will be replaced by silver.

Smooth transition period

The gradual transition from replacing the “old by the new” should be finished till end of Q1 2019.
